

Part B

You are going to design and implement the following functionalities and integrate them with the Part A. If Part A is not yet completed, you can complete it and integrate with the Part B.

- Users in a trip should be able to search places to be visited and add them to that trip.
- Users in a trip should be able to delete the places from that trip.
- Users in a trip should be able to see round trip route in a google map (embedded in an activity/fragment) with places, which are added already to that trip.
- (Optional) Users in a trip should be able to launch google maps app(Android App for Google Maps) to navigate between the places, which are added already to that trip.
